***Website* management *system* has server-side frontend daemon to
identify attributes of user-changed *webpage* and to store *identified*
attributes in database**

Abstract (Basic):

... A file *system* (45) performs caching of all *webpages* in a
web *site* and transmits the pages to a web server (20) for *storage*
in a database (50) by associating with respective attributes. A
server-side frontend daemon (35) *identifies* the attributes of
user-changed *webpage* and stores the *identified* attributes in the
database. A server-side backend daemon (40) parses the attributes to
generate partially static *webpages*.

... has a user manager to create a hierarchy of group or user
access, to the *web* *pages*, an asset manager for *finding*, uploading
or organizing the assets including a binary file, a page manager to
create new *webpages* or to modify existing *webpages*, a sub-directory
navigation manager to display *webpages* in one of the collapsible,
indented and tabular directories, a forum manager to create and...

...a knowledge base manager for addressing user problems, a preference
manager for defining site-wide *configuration* defaults, an object
manager for creating and modifying a definition and an instance of the
...

...and an error report manager for reporting the error in intended user
changes to request *webpage*.

...

...For management of *web* *sites* featuring asset management, forums, chat
rooms, virtual shopping carts, calculators, statistics reports...

...Permits users to interface with web management tool through e.g.
Internet browser, without a client-side application, thereby
eliminating the need for users to *buy* and master additional
software. As the *system* could advantageously reside in *Internet*
service provider, the cost of shrink-wrapping is eliminated and
optional *automatic* on-line *software* *upgrades* is facilitated.
Allows the user to create and review changes to a *webpage* directly on
world *wide* *web* in real-time. Enables the *system* to be server-
side application usable with any major platform and any server

software. Provides an elegance simple powerful and inexpensive content management tool to allow users to design and manage simple *web* *sites*, to complex database driven *websites*.

...The figure shows the block diagram of the *web* *site* management *system*.

...file *system* (45

***Automatic* *memory* *upgrade* *purchasing* transaction, that
determines a *memory* *upgrade* option which, after user approval, is
automatically initiated**

Abstract (Basic):

... The *purchasing* transaction is initiated by a request from the user that automatically *obtains* *memory* *configuration* information.
A *memory* *upgrade* option is then *determined* and, with user approval, *purchased*.
... For a *computer* *system*.

...The figure shows a flow chart of the *purchase* transaction process for a *memory* *upgrade*.

***Automatic* production schedule drafting method for production planning of installation...**

...involves writing installation code *obtained* based on final product name code of produced production planning data, in final product name table of *memory*

...Abstract (Basic): NOVELTY - An *updating* unit (224) *updates* a production schedule table (32) stored in a *memory* (3) based on recalculated final schedule data. An installation code *obtained* based on final product name code of produced production planning data, is written in a final product name table (31) of the *memory*. DETAILED DESCRIPTION - A data processor (2) has a production unit (211) which produces production planning...

...on data input from an input device (1). A search unit (221) searches for and *obtains* an installation code from a final product name table (31) stored in a *memory* (3), using the final product name code of produced production planning data as a key. A load *check* unit (223) investigates whether a schedule has been free, by searching a production schedule table (32) stored in the *memory*, using *acquired* installation code as a key. The load *check* unit recalculates a final schedule data, by the production *capacity* of the installation, when the schedule is free...

...ADVANTAGE - Performs *automatic* production schedule drafting with minimum die change time, thereby assigning identical finish name of an article continuously. DESCRIPTION OF DRAWING(S) - The figure shows the components of production schedule drafting *system*. (2) Data processor; (3) *Memory*; (31) Final product name table; (32) Production schedule table; (211) Data production unit; (221) Search unit; (223) Load *check* unit; (224) *Updating* unit...
